CHAPTER 0

INTRODUCTION

Congratulations ! Now you have a fantastic and powerful computer of your own. This manual will guide if you to use BIT90 computer and program BASIC language. No matter you have never worked with a computer before or if you have been familiar with the BASIC language, this manual would help you to make the best use of BIT90.

This manual is arranged in the sequence of following steps:

STEP 1 : How to turn on your BIT90, and some points to notice when BIT90 is turned on.

STEP 2 : Understanding your keyboard

Before you enter the BASIC of BIT90, you must have studied the keyboard, especially the **FCTN**, **BASIC**, **D** key etc.

STEP 3 : How to use one-key BASIC

Besides the BASIC function of general purpose, BIT90 also has a special function, one-key BASIC, for beginners to start with.

STEP 4 : Introduction to BIT90 commands and statements

If you are a beginner, you may start with some simple BASIC programs to enter the world of computer. If you have years of experiences in using computer, here are some useful and powerful commands, especially those for graphics and sound effect, can be applied specifically to BIT90.

STEP 5 : How to program your BASIC language

In this section, you may try to talk to your computer and enjoy it with some interactive programs. For further information about BASIC programming and others, please refer to "BIT90 BASIC MANUAL".

STEP 6 : How to use cassette recorder

BIT90 has a high speed cassette interface for data and program which can be transferred between your recorder and computer.

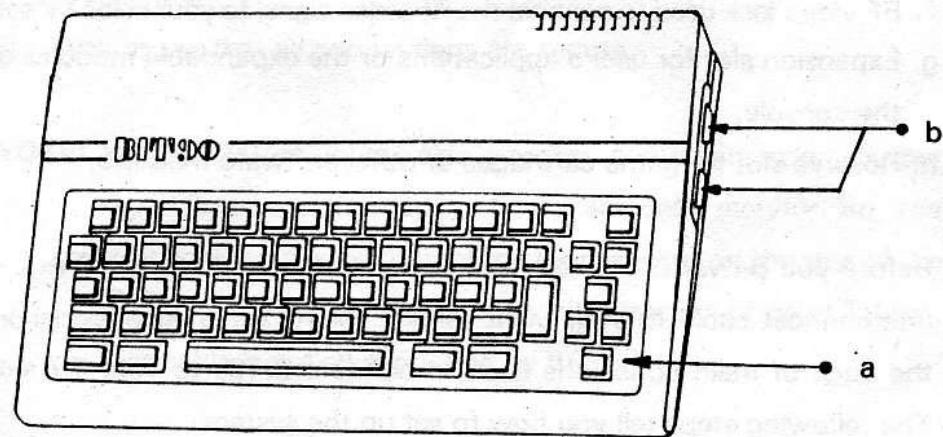

This's all for the outline. Now, let's waste no more words and get started on chapter one

CHAPTER 1

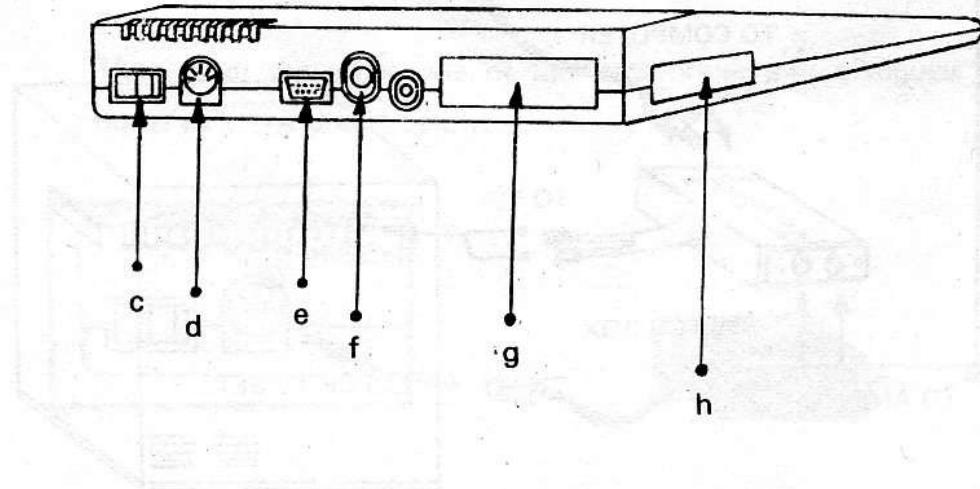

HOW TO POWER ON YOUR BIT90 COMPUTER

1. An overview of your computer

Your computer console is the central part of your computer system so that all of the other units can be easily connected to it. No other tools are required. Let's take a look at the front and right side of your BIT90.

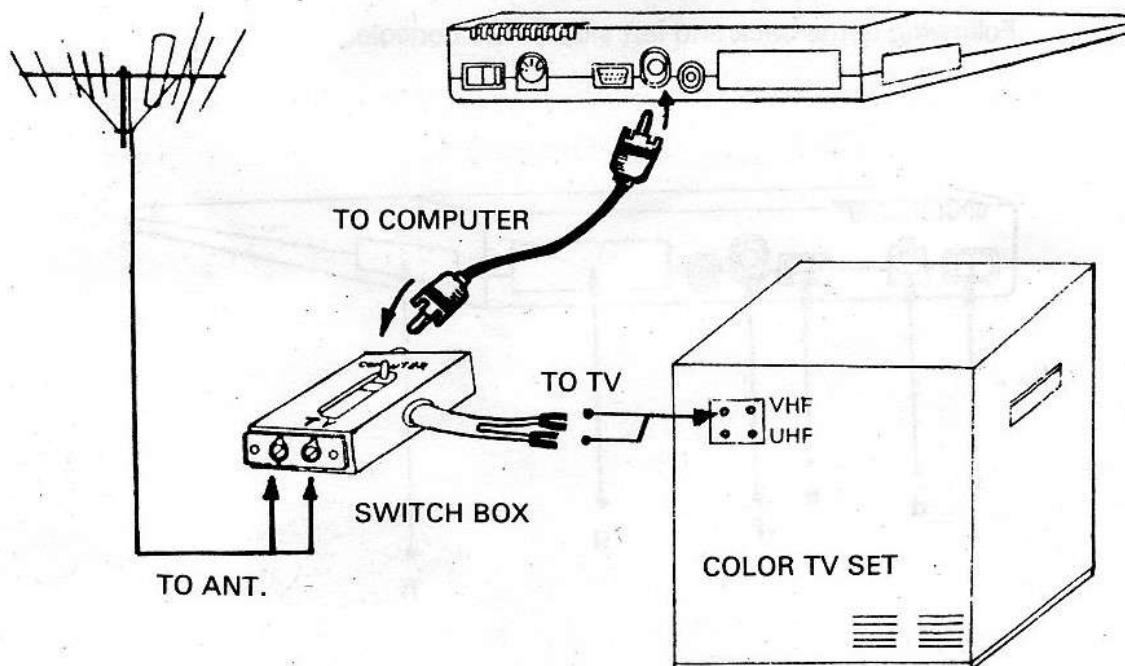

Following is the back and left side of the console.

- a. 66-key keyboard for user to type information into the computer.
- b. Joystick jacks used to play video games or other application of user's design.
- c. Power on/off switch to turn on or turn off the computer.
- d. DIN jack where you attach the power cord to the console.
- e. 9-pin jack, pin-3 and pin-5 are the tape load and tape dump respectively, pin-6 is the video output signal used to connect a composite video monitor, pin-8 is the audio sound output.
- f. RF video jack used to connect the RF video signal to your color TV set.
- g. Expansion slot for user's applications or the expandable modules of the console.
- h. Reserve slot for game cartridges or other software modules.

2. Before you power on BIT90, you must have connected the TV interconnect cable to your color TV set. The RF video outlet signal on the back of main console is used to connect BIT90 to your TV set. The following steps tell you how to set up the system.

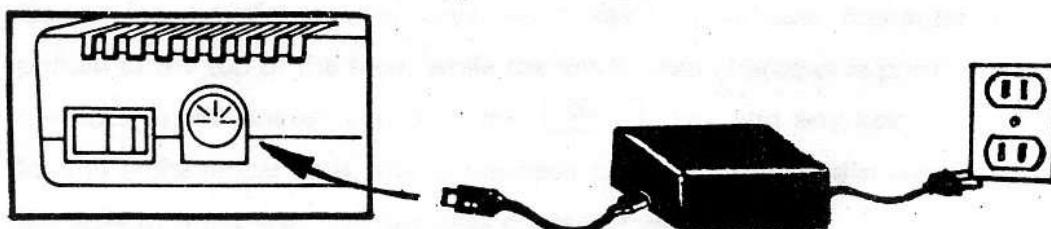

- 1) Remove the VHF antenna cable from your TV set.
- 2) Connect the TV interconnect cable from "Video" output outlet on the back of BIT90 to the switch box. Then, connect the VHF antenna cable of the box to the VHF antenna terminals on your TV set.
- 3) Whenever you use your TV set and BIT90 together, set the "TV/ COMPUTER" switch on switch box to "COMPUTER".
- 4) Make sure both the computer and your TV set are plugged into a live wall outlet.
- 5) Check to see that all connections are secure.

NOTE: Your BIT90 computer also supplies composite video output signal for connecting to your Composite color monitor. So, you may connect the cable from the 9-pin socket on the rear of the BIT90 to the composite color monitor instead of color TV set. This cable is option supported by BIT CO.

3. Connect Power Cords

Next, connect the DC power cord (with transformer) to the computer. Connect the small 5-pin plug end into DIN JACK on the back of the computer as shown below: (**NOTICE:** the pins only line up one way)

Then, plug the other side of the transformer into a regular wall outlet as in the sketch below:

After connecting the TV cable and power cord to the computer, just turn on the power switch on the back of BIT90. Your TV screen will display the color title "BIT90", and just a moment, it will display "BIT90 BASIC 3.0" and prompt ">". Yet, if you have plugged a game cartridge into the slot in the left side of the console, the computer will enter the game mode for entertainment.

Having entered the BASIC mode, your TV screen displays as follow with a sound "BEEP":

BIT90 BASIC 3.0

READY

>

Memory size may be tested by "FRE" command. But if you have expanded the memory to 32 K, it will show you "32760". Until you have typed into computer a BASIC program, there will be a red square flashing on the screen. If this message doesn't appear, check connections of the devices again.

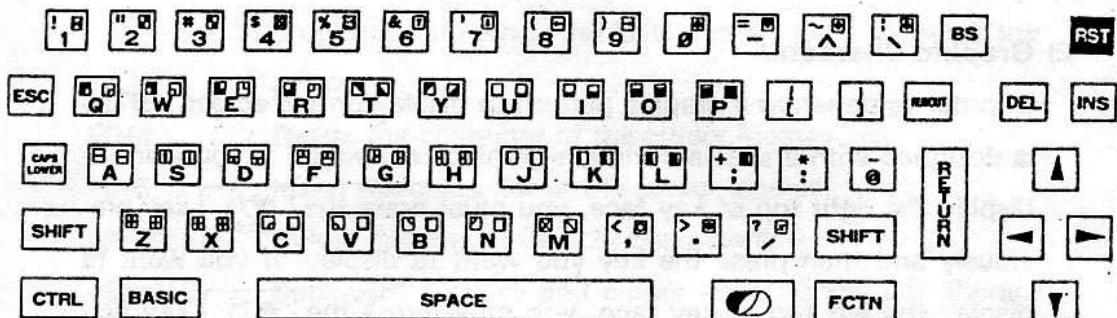

NOTICE: Do not quickly repeat the ON/OFF operation of BIT90 or connected devices. It may cause trouble or malfunction.

When you erroneously turn off the power switch of BIT90, programs stored in the main memory of the BIT90 will be lost. Important programs must be recorded and stored on a tape before turning the computer off.

CHAPTER 2

UNDERSTANDING YOUR KEYBOARD

An overview of the keyboard

This keyboard of BIT90 computer is like a standard typewriter with keys of several types. Pressing any alphabetical key causes its upper-case (large capital) character to display on the screen. After having pressed the **CAPS LOWER** key then pressing any alphabetical key, you would get the lower-case (small capital) character. If you have held down the **SHIFT** key the **CAPS LOWER** key then pressing any alphabetical key, on the screen there will be the upper-case (large capital) character for that key.

Except for the alphabetical keys, each key's upper-case character is printed at the top of the face, while the lower-case character is printed at the bottom. Whenever you type the **SHIFT** key and any key except for the alphabetical keys, the upper-case character will be displayed on the screen, otherwise, the low case character will be.

Some of the keys also have special functions as explained the following sections.

1) Automatic Repeat

BIT90 is designed with an automatic repeat function. If you held down any key for more than one second, that character is repeated until you release the key.

2) Graphic Character

In order to generate a graphic pattern to display on the screen, BIT90 is designed with a special function-graphics character. If you want to display the right top of key face, you must press the  key previously and then press the key you want to display. If you want to display the left top of key face, you must press the  key first and then press the  and the key you want to display simultaneously. For example, when you want to display the graphic character  , you must type the  key first, then press the  and  at the same time. If you want to display the  , you just press the  key then the  . In BIT90 computer, there are 69 graphic characters can be used.

3) One-Key BASIC

For the purpose of using BASIC commands or statements easily, BIT90 computer provides a way to either the beginner or the BASIC hobbist to program your BASIC language quickly. To enter a token of BASIC, hold down the  key and press the appropriate command or statement key of BIT90 BASIC. For example, when you want to generate a "THEN", you only hold down the  key and press the 

4) Special control keys

Several keys function variously in BIT90 BASIC, such as RST, ESC, DEL, INS, RUBOUT, BS,etc.

- RST : When power on, the system enters a cold start; press the RST key, the system enters a warm start.
- ESC : In BIT90 BASIC EDIT mode, the ESC key is equal to RETURN. While listing the BASIC program, pressing the ESC key should stop the program listing. If the BASIC program is running, the ESC can be used to break the program.
- DEL : Delete the character of the cursor locates.
- INS : Insert the character of the cursor locates.
- RUBOUT: Delete one line buffer 120 characters.
- BS : Backward a space and cursor shifts to the left character, that character will be replaced a space.
- : These keys are used to move the cursor one space in the direction shown by arrow to correct the sentences. Correction on the screen is performed by utilizing the DEL, INS, RUBOUT, keys.
- RETURN : Tell the computer user has entered a command to process.
When the RETURN key is pressed after correction on the screen, the corresponding program within the memory is corrected in the same manner as displayed on the screen. The RETURN key may be pressed at any time regardless of the cursor position on a given line.

5) Function keys

BIT90 computer has reserved 10 functions for user definition. The FCTN key is entrance point. You can hold down the FCTN key and press the number keys (0-9), thus, your computer will respond with

the value (224 — 233) to your for executing your special function ---- program. In BASIC program, you may use "INPUT" command to read a code to determine which program will be executed by your computer. There is a simple example as shown below for you to modify it in application.

[EXAMPLE]

```
>LIST
10 HOME :PRINT :PRINT
20 PRINT "** PLEASE PRESS FUNCTION KEY ?"
30 A=ASC( INKEY$ )
40 IF A<224 OR A>233 GOTO 30
50 PRINT :PRINT :PRINT "FUNCTION ";A-224
60 PRINT :PRINT :GOTO 20
```

READY

6) Math or Operation keys

The math keys (or operation keys) are the keys used to instruct the computer to add, subtract, multiply, divide and raise a number to a power. The symbols for addition, subtraction and equals are the usual ones you're familiar with, but the multiplication and division symbols may be new to you.

+	ADDITION
-	SUBTRACTION
*	MULTIPLICATION
/	DIVISION
=	EQUALS

The "caret" key (^) is also used for mathematical operations. This symbol tells the computer to perform exponentiation (raise a number to a power). Since 3^5 cannot be easily printed on your screen, the computer interprets 3^5 to mean that five is an exponent.

7) Space Bar

The space bar is the long bar at the bottom of the keyboard. It operates just like the space bar of any common typewriter. When you press the bar, the computer leaves a blank space between words, letters or numbers. Besides, the space bar can also be used to erase characters already on the screen. In general, a blank space can occur almost anywhere in a program without affecting the execution of the programs.

8)

When the "LIST" command is executed, the screen will display user's program line by line. To stop listing, you should hold down the   keys then release, and hold down the   keys again to go on listing.

9) PLAY GAME

Instead of using joystick with keypad, you may play the cartridge's game just use the keyboard only, these keys 1-8 number keys and "#", "*" keys on the keypad can be found on the keyboard of BIT90. The direction up, down, left, right can be controlled by

    keys. The FIRE and ARM keys can be replaced by  and  respectively.

CHAPTER 3

INTRODUCTION TO BIT90 BASIC COMMANDS AND STATEMENTS

1) What's the BASIC language?

BASIC is "Beginner's All-purpose Symbolic Instruction Code", in short, a high level language used in computational problems and is especially suitable for the beginners.

Every computer language has its own grammar, we must obey the rules to communicate with the computer. This manual describes the rules of BIT90 computer.

BASIC language can be divided into statements and commands. A statement is composed of executable-statement and non-executable-statement.

2) Feature of BIT90 BASIC

1. In BIT90 BASIC mode, user can type a program with multi-statements or a very long statement but not exceed 120 characters in a line buffer.

2. Editing facilities:

Use the "EDIT" command to delete, replace the statement input, insert a new statement or replace some characters of a statement. BIT90 computer has the ability of line-edit to move the cursor four directions (up, down, left, right) in a line buffer (120 characters) freely.

3. Immediate execution mode:

You may type a command, the computer can execute it immediately. You need not type a complete program, even the line number is not necessary.

4. Non-executable-statement can be located anywhere without being restricted.
5. Graphic mode:
User can define the graphic mode by himself and use the plot command to control the screen effect.
6. Hard Copy:
BIT90 BASIC has a command "COPY" to record the characters of screen.
7. Line TAB controllable:
In a "PRINT" statement variable is separated by ",", the print location of data can be programmable.
8. Save and load program:
User can save and load his own program between the computer and cassette tape recorder very easily.
9. The line number can be generated automatically by the command "AUTO" and adjusted by "RENUM", "GOTO" and "GOSUB" will be adjusted as well.
10. Append Program:
Load a program from cassette recorder can be appended to the other program completely. With the command "RENUM", we can accomplish a new program or with "NEW" to clear old program.

3) BIT90 BASIC COMMANDS DESCRIPTION

1. COMMAND

DEL [line_number] [-] [line_number 2]

The program lines specified are erased from memory.

e.g. 10 PRINT "ABC"

> 20 PRINT "DELETE EVERYTHING"

> DEL

SYNTAX ERROR

> DEL 10-

READY

> LIST

READY

>

EDIT line_number

Displays a line for editing.

2. COMMAND AND STATEMENT

AUTO [initial_line] [,increment]

Automatically generates sequenced line numbers starting at 10 in increments of 10. Optionally, initial line and/or increment may be specified. The line number is limited in range 1 to 999, if the user try to type a line_number out of this range, BL ERROR will be displayed. If the line_number is generated by AUTO command, it will return to BASIC command level.

There are two ways to terminate AUTO command:

Line number directly followed by a CR. Note that this line will be erased from program.

Press 'RUBOUT' key and enter new command.

e.g. > AUTO 9990

> 9990 PRINT "HEY!"

> (no line number generated)

BYE

Closes open files and leaves BASIC mode.

CONT

Resumes execution after breakpoint has been encountered.

The message "CAN'T CONTINUE" will be displayed on the screen if

1. Enter a CONT command after the program has been edited. :
2. There are no programs in memory.

```
>10 A = 10
>20 B= A/5
>30 STOP
>40 PRINT B/A
>RUN
    BREAK IN 30
>PRINT B
2
>CONT
.2
READY
>
```

CALL CHAR (char-code, pattern_identifier)

Redefines specified char_code by using 16 hexadecimal coded characters coded string. The char_code is in the range 0 to 255, if the hexadecimal string less than 16 characters, computer assumes to be '0' for remains.

>CALL CHAR (65, "FFFFFFFFFFFFFF")

(pattern A is change to be a block)

CALL CHRCOL (character_set, foreground_color, background_color)

Specifies foreground and background colors of all characters in the specified set.

There are 32 character_sets in BIT90 computer. The color of each character_set may be defined individually. the character_set is ranged from 0 to 31, while foreground and background color from 0 to 15. If the range is exceeded but less than 65536, computer will round to be acceptable value. If the value specified greater than or equal to 65536, message 'BS ERROR' will be displayed on the screen.

character_set	character_code
0	0-7
1	8-15
2	16-23
3	24-31
4	32-39
5	40-47
6	48-55
7	56-63
8	64-71
9	72-79
10	80-87
11	88-95
11	96-103
13	104-111
14	112-119
15	120-127
16	128-135
17	136-143
18	144-151
19	152-159
20	160-167
21	168-175
22	176-183
23	184-191
24	192-199
25	200-207
27	216-223
28	224-231
29	232-239
30	240-247
31	248-255

color_code	color
0	transparent
1	black
2	medium green
3	light green
4	dark blue
5	light blue
6	dark red
7	cyan
8	medium red
9	light red
10	dark yellow
11	light yellow
12	dark green
13	magenta
14	gray
15	white

e.g. >CALL CHRCOL (6, 9, 1)

(the color of character '0' to '7' are changed to be light red with black background.)

CALL HCHAR (row, column, character_code[, repetition])

Places ASCII character at specified row (0-23) and column (0-31), optionally repeats it horizontally.

e.g. >CALL HCHAR (0, 0, 65, 768)

(the screen is filled by "A" character)

CALL SCREEN (backplane_color [,screen mode])

Defines screen color or optionally screen mode. If mode 1 or 2 is selected, the screen is cleared first.

Note: If screen mode 0 is selected, the character pattern will be reset to standard pattern.

mode	display
0	Text mode (32x24 characters)
1	High resolution graphics (256x192 dots)
2	Low resolutions graphics (64x48 dots)

e.g. > CALL SCREEN (13, 0)
 (defines screen mode to be normal text mode with backplane
 color magenta)

CALL SPRITE ([y_position],[x_position],[sprite pattern number],
 [color],sprite number)

Defines x_position (0-255),y_position(-31 to 207),color, and
 pattern_number (0-255) of specified sprite_number (0-31).

e.g. > 10 CALL SPRPTN (1,"FFFFFFFFFFFFFF")
 > 20 FOR I = 0 TO 255
 > 30 CALL SPRITE (100, I, 5, 1,1)
 > 40 NEXT I
 (moves a blue block from left to right)

CALL SPRPTN (pattern_number, pattern_identifier)

Defines specified sprite pattern_number of sprite using 16 hexa-decimal coded characters string.

e.g. > 10 SP\$ = "3C7EFFFFFFF7E3C"
 > 20 CALL SPRPTN (1,SP\$)
 30 CALL SPRITE(10,10,1,3,1)

CALL numeric_expression

Calls Z80 assembly language subroutine with starting address evaluated by numeric_expression.

> NEW

> CALL A

(warm start)

CLEAR

Sets all numeric variables to zero and all string variables to null.

> DIM A(254)

OUT OF MEMORY

CLEAR

READY

> FRE

761

READY

>

COPY [ON]

COPY OFF

Initializes and sets hard copy mode to copy the characters of screen to printer. To use this statement, the printer interface (with CENTRONIC interface) must be connected. The number N of characters per line is controlled by memory address 29504. Command COPY [ON] is used to enable copy, while COPY OFF to disable.

> POKE 29504, N-1

> COPY ON

> LIST

(Turn on printer and set N characters per line prints)

For BASIC version 3.1 COPY is used with 40 column dot matrix printer.

DEF FN function_name[(parameter)] = expression

Associates user-defined numeric or string expression with FN function_name. This function_name mustn't be the same as a variable name.

DIM array_name ([integer1][,integer2][,integer3]) [,...]

Dimensions the listed arrays as specified by integers.

This integer is default to be 10 for 1 dimension array if it's not specified.

[END]

Terminates program execution. This statement may be omitted if used as last statement in a program.

FOR control_variable = initial_value TO limit (STEP increment)
Repeats execution of statements between FOR and NEXT until the control_variable exceeds the limit, STEP default is one.

GOTO line_number

Unconditionally branches to specified line_number.

INPUT ["prompt",] variable_list

Suspends program execution until data is entered from the keyboard. The optional input_prompt indicates data to be entered. The input_prompt default is "?".

INPUT *print_list:variable_list

The same as above except that the print_list is PRINTed before accept data.

HOME

Clears the display screen and moves the cursor to the upper lefthand corner.

IF relational_expression|number_expression THEN statement(s)1

[ELSE statement(s)2]

Transfers control to statement(s)1 if the relational expression is true or the numeric expression is not equal to zero, control pass to the next statement or optionally to statement(s)2 if the relational expression is false or the numeric expression is equal to zero.

[LET] numeric_variable = numeric_expression

[LET] string_variable = string_expression

Assigns the value of an expression to the specified variable.

e.g. > A\$ = "HEY!"

> VALUE = 3.58

> NUMBER = "123"

TM ERROR

LIST [[line_number][—][line_number2]]

Sequentially displays program statements and optionally a single line number or all lines between the specified line_numbers.

a ESC or "?" character may be pressed to stop or pause listing.

ESC key may be used to abort listing. "?" may be used to pause listing until another "?".

> LIST

10 TEMPO 5

20 MUSIC 0,—15, "CDEFGAB + C"

LOAD ["filename"]

Loads a BASIC program from cassette tape into the computer's memory. Filename is a string expression with length from 1 to 15 characters. If the filename is omitted, computer loads the first file with type '.B' from current tape position.

BLOAD ["filename"]

Loads a memory image file from cassette into memory. Filename is a string expression with length from 1 to 15 characters. The BLOADED

file may be binary data or machine language which is BSAVEd previously. If the filename is omitted, computer loads the first file with type '.M' from current tape position. The filenames searched by computer are displayed on the screen followed by a period(.) and a single letter. These informations are described as follows:

.B for BASIC program in compressed binary format.
(created by SAVE command)

.M for memory image files (created by BSAVE command)

>BLOAD "BABY"

READY ? Y

* TYPE LOAD:

BABY.B

BABY.M

* END *

READY

>

NEXT [control_variable]

Refer to FOR statement.

MUSIC channel_number, volume(*),string1(),string2(),.....)

Prepares a score for PLAY command to start music playing. Channel
may be integer 0 to 2

octave: + high

middle

- low

note: CDEFGAB# and R(rest)

length:	unit	code
1/32	0	
2/32	1	
3/32	2	
4/32	3	

6/32	4
8/32	5
12/32	6
16/32	7
24/32	8
32/32	9

volume: absolute value from 0(quietest) to 15(loudest).

negative value obtains sustain sound effect. If volume = 0, then the specified channel is closed immediately, and the arguments follow volume are don't cared.

```
>10 TEMPO 3
>20 MUSIC 0,15,"C"
>30 MUSIC 1,15,"E"
>40 MUSIC 2,15,"G"
>50 PLAY
>60 FOR I=0 TO 100
>70 NEXT
>RUN
```

(computer plays C major chord)

loop play: with option*, the score is played repeatedly.

```
>10 MUSIC 0,-15,*,'EE3E3E3D3C-A3-
G3C3E3G3E3DEE3E3E3D3C-A3-G3E3D3C7"
>20 PLAY
>30 CALL SCREEN(1,1)
>40 FOR I=0 TO 255
>50 PLOT SIN(I/20)*50 + 100,I,15
>60 NEXT
70 END
```

(plays a musical tune and plots a sine wave)

NEW

Clears memory and prepares computer for new program.

OUT numeric_expression1, numeric_expression2

A value between 0 and 255 inclusive, provided by numeric_expression2 is output to output_port address provided by numeric_expression1. Numeric_expression1. is also a value between 0 and 255.

PLAY

Begin to play music

There are some interferences when music playing

Case	Result
Run "CLEAR"	To play wrong note
Run "HOME"	

Change screen mode will delay to play music when running.

PLOT [Y₁,X₁ [,COLOR1][TO]Y₂, X₂,COLOR2][TO Y₃,X₃ [,COLOR3]]

[...]

Plots a dot or draws a line for specified coordinates if color is omitted, it's determined by last PLOT command which specified color.

for screen mode 2

x=0-63

y=0-47

for screen mode 1

x=0-255

y=0-191

e.g. > 10 CALL SCREEN (1,1)

> 20 PLOT TO RND (191),RND(255),RND(13)+2

> 30 GOTO 20

(Draw random lines with random color)

e.g. > 10 CALL SCREEN (1,1)
> 20 FOR I=0 TO 255
> 30 PLOT SIN(I/20)*50+100,I,15
> 40 NEXT
(plots a sin wave with screen mode 1)

POKE numeric_expression1 ,numeric_expression2

A value between 0 and 255, provided by numeric_expression2 is written into memory location provided by numeric_expression1 . Numeric_expression1 is value between 0 and 65535.

PRINT [print_list]

The position of each print item is controlled by comma or semicolon. A common causes the next printable item to be printed at the beginning of the next TAB stop. A semicolon causes the next printable item to be printed immediately after the last item.

If no print_list exists, the next print position will be at the beginning of the next line.

? [print_list]

e.g. >? "HEY! HOW ARE YOU?"

HEY! HOW ARE YOU?

READY

>

RANDOMIZE

Resets random number generator to an unpredictable sequence.

e.g. > 10 PRINT RND (1)

> 20 GOTO 10

> RUN

.648045

.794064

.248135

BREAK IN 10 (ESC key is pressed)

READY

>RUN

.535669

.268712

.743119

.863714

.589787

BREAK IN 20 (ESC key is pressed)

REM

Indicates internal program documentation. The statement delimiter ":" is ignored in this statement.

RENUM [initial_line][,increment]

Renumerates program statements starting at 10 in increments of 10.

Optionally an initial line number and/or increment may be specified.

NOTE: The computer will take some time if program is large,

please wait.

e.g. >AUTO

>10 INPUT A,B

>20 PRINT A+B

>30 GOTO 10

>RENUM 5,5

>LIST

>5 INPUT A,B

>10 PRINT A+B

>15 GOTO 5

RESTORE (line_number)

Resets the DATA list pointer to the beginning of the list or to the first DATA statement after specified line.

>10 READ A,B

```
>20 DATA 1,2  
>30 PRINT A,B  
>40 RESTORE  
>45 READ A,B  
>50 PRINT A,B  
>60 DATA 3,4  
>RUN

```

```
READY
```

```
>
```

RUN [line_number]

Start program execution at the lowest numbered statement or optionally at the specified line number.

SAVE filename

Places a copy of current BASIC program on the cassette tape.

BSAVE filename,start_address,length

Saves binary contents of computer's memory on cassette tape. If any parameter is omitted, a message "SYNTAX ERROR" will display on the screen and the save is cancelled. Start_address and length are numeric expression in the range from 0 to 65535.

```
> BSAVE "BIT90",32768,1024
READY ? Y
* TAPE DUMP : BIT90.M
* END *

>
```

STOP

The line of this statement is used as a breakpoint. Whenever it is performed, the message "BREAK IN line_number" is displayed on the screen. The program is continued by CONT command.

[TEMPO numeric_expression]

numeric_expression is ranged from 0 to 255. Default value is 5 if this statement omitted.

TRACE

Lists line numbers of statements before they are executed.

UNTRACE

Cancels the TRACE command.

WAIT input_port,numeric_expression1[,expression2]

Suspends program execution while monitoring the status of an input_port(0-255).

The data input from input_port is XOR'ed with numeric_expression2 and AND'ed with numeric_expression1. (default is 0 if omitted)

Program continues with the next statement when the result is nonzero.

3. STATEMENT:

DATA data_list

Stores numeric and string constant data in a program.

GOSUB line_number

Transfers control to a subroutine at specified line_number until RETURN encountered. The subroutine(s) may be called by another subroutine (next), there may be 10 levels of nesting in BIT90 BASIC.

ON numeric_expression GOSUB line_number_list

Transfers control to the subroutine with a beginning line_number in the position corresponding to the value of the numeric expression.

ON numeric_expression GOTO line_number_list

Unconditionally branches to line number in the position corresponding to the value of the expression.

e.g. > 5 CALL SPRPTN (1, "183C73FFFF7E3C18")

> 6 CALL SPRPTN (128,96,1,9,1)

> 10 INPUT D

> 20 ON D GOTO 40,50,60,70,80,90,100,110

> 30 GOTO 10

> 40 X=X+1:GOTO 200

> 50 X=X+1:Y=Y+1:GOTO 200

> 60 Y=Y+1:GOTO 200

> 70 X=X-1:Y=Y+1:GOTO 200

> 80 X=X-1:GOTO 200

> 90 X=X-1:Y=Y-1: GOTO 200

> 100 Y=Y-1:GOTO 200

> 110 X=X+1:Y=Y-1:GOTO 200

> 200 CALL SPRITE (Y,X,,,1)

> 210 GOTO 10

> RUN

(control a sprite for 8 directions moving)

OPTION BASE 0|1

Sets the lowest allowable subscript of arrays to zero or one.

Default is 0.

READ variable_list

Assigns number and string constants in DATA statements to variables listed.

RETURN

Transfers program control from subroutine to statement following corresponding GOSUB or ON....GOSUB statement.

4. FUNCTION:

ABS (numeric_expression)

Returns absolute value.

ASC (string_expression)

Returns the ASCII code of the first character of the string expression.

ATN (radian_expression)

Returns trigonometric Arctangent.

CHR\$ (numeric_expression)

Returns the string character corresponding to the ASCII code.

COS (radian_expression)

Returns trigonometric consine.

EXP (numeric_expression)

Returns exponential value of the argument.

FNfunction_name

See DEF statement

HEX\$ (decimal_argument)

Returns a string which represents the hexadecimal value of the decimal argument.

IN (numeric_expression)

Returns the content of a input port.

INKEY\$

Returns either a one character string containing a character read from the keyboard or character with its code 255 if no character is pressed on the keyboard.

INT (numeric_expression)

Returns greatest integer less than or equal to the argument.

JOYST (key_unit)

Returns key code of correspondent key unit.

key unit return value

- | | |
|---|----------------|
| 1 | play1 joystick |
| 2 | play2 joystick |
| 3 | play1 keypad |
| 4 | play2 keypad |

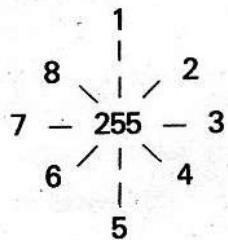

Negative value of joystick indicates fire is pressed.

Negative value of keypad indicates arm is pressed.

keypad pressed return code

1-9	1-9
0	10
*	11
#	12
none	255

joystick return code:

LEFT\$ (string_expression, length)

Returns a substring beginning from the leftmost character with the specified length.

LEN (string_expression)

Returns the number of characters in the string expression.

LN (numeric_expression)

Returns natural logarithm.

LOG (numeric_expression)

Returns logarithm.

MID\$ (string_expression, position, length)

Returns a substring beginning in the specified position with specified length.

PEEK (numeric_expression)

Returns the content of memory location.

POS

Returns the current cursor position. The leftmost position is 1.

RIGHT\$ (string_expression,length)

Returns a substring ending with the rightmost character with the specified length.

RND (numeric_expression)

Generates a pseudo_random numer with range in zero and specified value.

SGN (numeric_expression)

Returns 1 if argument is positive, 0 if argument equals zero, -1 if argument is negative.

SIN (radian_expression)

Returns the trigonometric sine.

SPC (numeric_expression)

Prints specified blanks on the screen.

SQR (numeric_expression)

Returns square root.

STR\$ (numeric_expression)

Converts the value of the argument into a string.

TAB (numeric_expression)

Controls column position of the cursor.

TAN (radian_expression)

Returns the trigonometric tangent.

• **VAL (string_expression)**

Converts a string representation of a number into a numeric constant.

CHAPTER 4

HOW TO PROGRAM YOUR BASIC LANGUAGE

When you use BIT90 to execute a program, at first, you must clear the memory to prevent your program from being confused. So, type a "NEW" command to start with a new program.

For example:

> NEW (CR)

If you type a program into the computer, which is perhaps not the correct one, you should display this program and modify it. The procedure named "EDIT" is used very often in entering a new program.

For example:

1. Please type the following program in sequence.

```
10 FOR I=1 TO 7  
20 FOR J=1 TO I  
30 PRINT "*";  
40 NEXT J  
50 PRINT  
60 NEXT I
```

2. When the program has been input by you, list it and run it.
3. If you cancel the statement of line number 50, what is the result after execution?

4. Try to change the "I" of line number 20 to "8-I" and execute it.

Now, we follow the above procedure to test this program step by step.

1.

```
>NEW (CR) ; CLEAR THE OLD PROGRAM.  
>LIST (CR) ; LIST VERIFIED NO OLD PROGRAM  
EXISTED.
```

READY

```
>AUTO (CR)  
>10 FOR I=1 TO 7 (CR)  
>20 FOR J=1 TO I (CR)  
>30 PRINT "*"; (CR)  
>40 NEXT J (CR)  
>50 PRINT (CR)  
>60 NEXT I (CR)  
>70 (CR)  
>
```

2.

```
>LIST (CR)  
10 FOR I=1 TO 7  
20 FOR J=1 TO I  
30 PRINT "*";  
40 NEXT J  
50 PRINT  
60 NEXT I
```

READY

>RUN (CR)

*
**

3.

50 (CR) ; DELETE THE LINE NUMBER 50.
LIST (CR) ; LIST THE NEW PROGRAM HAS
BEEN MODIFIED.

10 FOR I=1 TO 7
20 FOR J=1 TO I
30 PRINT "*";
40 NEXT J
50 NEXT I

READY

>RUN (CR)

4.

>EDIT 20 (CR)

20 FOR J=1 TO I ; SHIFT THE CURSOR ► TO THE
"I" LOCATES AND TYPE
; "8-I" THEN PRESS "RETURN".

```
20 FOR J=1 TO 8-I (CR)
>LIST (CR)
10 FOR I=1 TO 7
20 FOR J=1 TO 8-I
30 PRINT "*";
40 NEXT J
50 PRINT
60 NEXT I
```

READY

>RUN (CR)

```
*****
*****
*****
****
*****
**
*
```

From the above text program, you may find it's easy to learn BASIC language and edit it. Whenever you need help, just refer to the BASIC command description in chapter 3. In BIT90 computer, many useful and powerful commands can be applied especially those of graphics and music. For the purpose of learning BIT90 BASIC language very fast, we suggest you practise every command and statement following the example first. Thus, very soon, you will be expert in BIT90 BASIC language.

The following section, we will show you a few more interesting BASIC program, you may trace it and further modify with your own ideas.

*NOTE: These programs may require a 16K or 32K memory expansion module to be added, otherwise computer may display "OUT OF MEMORY" on the screen.

[EXAMPLE 1] Compute the combination of C(N,R)

$$C(N,R) = \frac{N!}{(N-R)! R!}$$

$$\text{e.g. } C(5,2) = \frac{5!}{3! 2!} = \frac{5 \times 4 \times 3 \times 2 \times 1}{3 \times 2 \times 1 \times 2 \times 1} = 10$$

[LIST]

```

10 READ N,R
20 IF N=0 GOTO 100
30 C=1
40 FOR I=N TO N-R+1 STEP -1
50 C=C*I/(N-I+1)
60 NEXT I
70 PRINT "C(";N;",";R;")=";C
80 GOTO 10
90 DATA 2,1,3,1,4,2,5,2,6,2,6,3,7,3,8,3,9,5,13,8,0,0
100 END

```

[RUN]

```

C(2,1)=2
C(3,1)=3
C(4,2)=6
C(5,2)=10
C(6,2)=15
C(6,3)=20
C(7,3)=35
C(8,3)=56
C(9,5)=126
C(13,8)=1287

```

[EXAMPLE 2]

Please input any positive or negative integer number and print it. Calculate the sum of the digits of this number (e.g. the sum of the digits of 123 is "1+2+3 = 6", the sum of the digits of 32768 is "3+2+7+6+8=26"), and print this sum. If this sum is multiple of 3, then print the value of this sum divided by 3 and "YES", otherwise print "NO" only.

[LIST]

```
10 PRINT B$  
20 INPUT "NUMBER=? ", A$

CHAPTER 5

HOW TO USE THE TAPE RECORDER FOR INFORMATION ACCESS ?

BIT90 computer has a built-in cassette interface for tape recorder, with this we can store the program to tape and load the program from it. Because the computer can't hold the data in memory when the power is removed, the most popular storage device is cassette recorder that can store the information permanently. On the other hand, the cassette recorder can also store a large amount of data with low cost. The data transfer speed of BIT90 is 2400BPS, so that a C-60 (30 minutes per side) tape can store about 1 mega bytes (or characters). Now, let's set up this useful storage device. Connect the data plugs RED & BLACK to the EAR PHONE and MIC on the cassette recorder respectively and plug the other terminal of the data cords into the 9-pin jack on the back of the console. Next, typical volume and tone control setting (highest treble positions) are indicated. Adjustments may be required for best performance, depending upon the individual recorder and tape used. Some recorders perform better because of their high-frequency response, which is necessary for good data recovery from computer.

OK ! Let's turn on the computer and type a test program. For example:

BIT90 BASIC 3.0 ; POWER ON COMPUTER AND TV
DISPLAY

READY

> AUTO (CR)

> 10 FOR I=1 TO 10 (CR)

> 20 PRINT I; I^2 (CR)

> 30 NEXT (CR)

> 40 END (CR)

> 50 (CR)

>

Now, we want to save this program into the cassette recorder, we may use the command "SAVE" and type a file name that can be any character even including reserved words, but can not exceed 15 characters. The following steps tell the computer to save a program.

STEP 1.>SAVE "TEST" (CR)

STEP 2.READ ? Y

STEP 3.* TAPE DUMP :

TEST.B

STEP 4.* END *

>

In step 2, the computer displays "READY" ?" means to ask whether you have set the cassette recorder ready. If so, record the cassette's counter and press the PLAY and REC keys on the cassette recorder, then, respond with "Y" to the computer.

In step 3, the computer begins to dump your program from the memory to the cassette recorder, and just for a few seconds, the computer will display "* END *" to show you the program has been dumped completely and you should press the "STOP" key to stop recording.

When the computer is turned on, you may also "read" a program from the cassette recorder. For example:

```
BIT90 BASIC 3.0
READY
STEP 1.>LOAD "TEST" (CR)
STEP 2.READY ? Y
STEP 3.* TAPE LOAD :
        TEST.B
STEP 4.* END *
```

In step 1, you must use the command "LOAD" of BIT90 BASIC and type the file name to be loaded, {the name may be any character even including the reserved words, but may not exceed 15 characters). After computer responds with "READY?" telling you to set the cassette recorder ready and rewind the tape back to the proper counter that you have recorded before, you shall type a "Y" to the computer if everything is ready.

In step 3, the computer displays "**TAPE LOAD:" means it is waiting for the cassette recorder to transfer information, and then, you just press the "PLAY" key on the cassette recorder. When the computer finds out the file you need, it will display the name and load this program. After a few seconds, the computer will load the program completely and display "** END **" on the screen. Perhaps the computer could not find out your file name, it will display the name found currently and search for the file name continuously. Yet, if you didn't type the file name but just type the command "LOAD" only, the computer will assume that you accept any file as it receives from cassette recorder.

If there is already a program in the computer, you may load another one into the computer, but it is important to link these two programs toge-

ther, it could produce line number or label duplicated occasionally. If there is not a command "GOTO" in the either program, the computer won't make an error message. Yet, sometimes, the program is very complex and we use "GOTO" very often, so that it is necessary to use "RENUM" command to prevent the label from being duplicated. For example:

- 1) If there is a program in the memory already, we can use the "LIST" command to list it.

> LIST (CR)

```
10 FOR I=1 TO 10
20 PRINT I,I^2
30 NEXT I
40 END
```

READY

>

If there is another program to be linked, then, we can load this program from cassette recorder.

> LOAD "TEST" (CR) LOAD A PROGRAM NAMED TEST

READY ? Y ; FROM CASSETTE RECORDER.

* TAPE LOAD :

TEST.B

* END *

Then, we list all the programs in the computer:

> LIST (CR)

```
10 FOR I=1 TO 10      ; OLD PROGRAM
20 PRINT I,I^2
30 NEXT I
40 END
10 PRINT "LAST I=",I ; NEW PROGRAM
20 END
```

In above label 10, 20 are duplicated, the computer can't execute this program. We may use the "RENUM" command to rearrange the label.

```
> RENUM (CR)           ; RENUMBER PROGRAM
> LIST (CR)            ; LIST PROGRAM AFTER RENUMBER.
10 FOR I=1 TO 10
20 PRINT I,I 2
30 NEXT I
40 END
50 PRING "LAST I=",I ; LABEL IS NOT DUPLICATED
60 END
READY
>
```

- 2) The following program is the other case in which appears the "GOTO" command and duplicated label.

```
> LIST (CR)
10 INPUT A,B          ; OLD PROGRAM
20 PRINT A*B
30 GOTO 10
```

READY

```
> LOAD "TEST1" (CR)   ; LOAD A NEW PROGRAM FROM
                        CASSETTE RECORDER.
```

READY ? Y

* TAPE LOAD :

TEST1.B

* END *

```
> LIST (CR)            ; LIST ALL PROGRAMS.
10 INPUT A,B          ; OLD PROGRAM
20 PRINT A*B
30 GOTO 10
```

```
10 INPUT C ; NEW PROGRAM  
20 PRINT CA2,C  
30 GOTO 10 ; LABEL IS DUPLICATED.
```

In the above program, the first label 30 and the second label 30 are the same statement: "GOTO 10". The first label 30 "GOTO 10" should jump to "10 INPUT A,B" and the second label 30 "GOTO 10" should jump to "10 INPUT C". If we use the command "RENUM" to adjust the line number directly, the computer will produce an error.

```
> RENUM (CR)  
> LIST (CR)  
10 INPUT A,B  
20 PRINT A*B  
30 GOTO 10  
40 INPUT C  
50 PRINT CA2,C  
60 GOTO 10 ; THIS STATEMENT SHOULD JUMP  
TO "40 INPUT C".  
  
READY ; NOT JUMP TO "10 INPUT A,B".
```

>

Now, let's go back to the old program and use the RENUM to rearrange the previous label.

```
> LIST (CR) ; LIST OLD PROGRAM  
10 INPUT A,B  
20 PRINT A*B  
30 GOTO 10  
READY  
> RENUM 1000 (CR) ; RENUM OLD PROGRAM TO 1000.  
> LIST (CR)
```

```
1000 INPUT A,B
1010 PRINT A*B
1020 GOTO 1000
READY
> LOAD "TEST1" (CR) ; LOAD A PROGRAM NAMED TEST1
; FROM CASSETTE RECORDER
```

```
READY ? Y
* TAPE LOAD :
TEST1.B
* END *
>LIST (CR)
1000 INPUT A,B
1010 PRINT A*B
1020 GOTO 1000
10 INPUT C
20 PRINT C2,C
30 GOTO 10
READY
>
```

Let's renumber this program once more:

```
> RENUM (CR)
> LIST (CR)
10 INPUT A,B
20 PRINT A*B
30 GOTO 10
40 INPUT C
50 PRINT C2,C
60 GOTO 40
READY
>
```

From the above case, obviously it's better to use RENUM command to change the label of previous source program. Having loaded next program from recorder, we then use RENUM again to connect these programs completely.

Besides Saving (or loading) of BASIC programs, BIT90 can also save (or load) binary data or machine language codes to (or from) cassette recorder for the purpose of playing cassette's game or special usage. User may refer to chapter 3 about these commands' description.

CHAPTER 6

CARE OF YOUR BIT90 COMPUTER

1. Place the main unit of BIT90 away from places of high or low temperature, direct sunshine (the main unit may be discolored), or dusty places. Locate it away from a place where the change of temperature is abrupt.
2. The unit is a precision piece, made up of electronic parts. Any modification of, or tampering with, inner parts may cause trouble or accidents.
3. Do not connect a home TV antenna, etc. to the RF converter output terminal of the BIT90.
4. Do not use any equipment other than optional units, to expand your system.
5. Do not drop or throw the main unit. Strong physical shocks must be avoided.
6. Locate the main unit away from a receiver such as a radio receiver since noise may be produced in the radio speaker when BIT90 is operated nearby.
7. Do not spill coffee, juice, tea, etc. over the main unit.
8. Do not disassemble the main unit. When trouble is found, contact the nearest service center immediately.
9. Do not connect the RF converter output terminal of the BIT90 to a home TV master antenna terminal. Use antenna switch box.
10. Do not use volatile solvents such as paint thinner or benzene for cleaning. Wipe the surface of the main unit with a dry cloth.

APPENDIX 1

CONTROL KEY CODES

ASCII CODE	MNEMONIC CODE	PRES	COMMENTS
1	SOH	CONTROL A	Start of heading
2	STX	CONTROL B	Start of text
3	ETX	CONTROL C	End of text
4	EOT	CONTROL D	End of transmission
5	ENQ	CONTROL E	Enquiry
6	ACK	CONTROL F	Acknowledge
7	BEL	CONTROL G	Bell
8	BS	CONTROL H	Backspace
9	HT	CONTROL I	Horizontal tabulation
10	LF	CONTROL J	Line feed
11	VT	CONTROL K	Vertical tabulation
12	FF	CONTROL L	Form feed
13	CR	CONTROL M	Carriage return
14	SO	CONTROL N	Shift out
15	SI	CONTROL O	Shift in
16	DLE	CONTROL P	Data link escape
17	DC1	CONTROL Q	Device control 1 (X-ON)
18	DC2	CONTROL R	Device control 2
19	DC3	CONTROL S	Device control 3 (X-OFF)
20	DC4	CONTROL T	Device control 4
21	NAK	CONTROL U	Negative acknowledge
22	SYN	CONTROL V	Synchronous idle
23	ETB	CONTROL W	End of transmission block
24	CAN	CONTROL X	Cancel

25	EM	CONTROL Y	End of medium
26	SUB	CONTROL Z	Substitute
27	ESC	CONTROL [Escape
28	FS	CONTROL \	File separator
29	GS	CONTROL]	Group separator
30	RS	CONTROL ^	Record separator
31	US	CONTROL _	Unit separator

APPENDIX 2

(1) ASCII CHARACTER CODES

The defined character on the BIT90 computer are the standard ASCII character for codes 32 through 127. The following chart lists these character and their codes.

ASCII		ASCII	
CODE	CHARACTER	CODE	CHARACTER
32	(space)	80	P
33	!(exclamation point)	81	Q
34	"(quote)	82	R
35	# (number or pound sign)	83	S
36	\$ (dollar)	84	T
37	% (percent)	85	U
38	& (ampersand)	86	V
39	' (apostrophe)	87	W
40	((open parenthesis)	88	X
41) (close parenthesis)	89	Y
42	* (asterisk)	90	Z
43	+ (plus)	91	[(open bracket)
44	, (comma)	92	\ (reverse slant)
45	- (minus)	93] (close bracket)
46	. (period)	94	\wedge (exponentiation)
47	/ (slant)	95	$\underline{}$ (line)
48	0	96	` (grave)
49	1	97	a
50	2	98	b
51	3	99	c

52	4	100	d
53	5	101	e
54	6	102	f
55	7	103	g
56	8	104	h
57	9	105	i
58	:(colon)	106	j
59	;:semicolon)	107	k
60	< (less than)	108	l
61	= (equals)	109	m
62	> (greater than)	110	n
63	?(question mark)	111	o
64	@(at sign)	112	p
65	A	113	q
66	B	114	r
67	C	115	s
68	D	116	t
69	E	117	u
70	F	118	v
71	G	119	w
72	H	120	x
73	I	121	y
74	J	122	z
75	K	123	{ (left brace)
76	L	124	
77	M	125	} (right brace)
78	N	126	~ (tilde)
79	O

APPENDIX 3

OPERATORS

SYMBOL	EXAMPLE	PURPOSE
\wedge	30 PRINT A \wedge 2	Exponentiation, A must be greater than 0
=	10 LET A=B	Assigns a value equal to a variable
/	20 C=A/B	Division
*	30 C=A*B	Multiplication
+	20 C=A+B	Addition
=	10 IF A=B GOTO 1000	A equals to B
<>	2 IF A<>B GOSUB 10	A does not equal to B
<	3 IF A<B THEN END	A is less than B
>	5 IF A>B THEN PRINT A	A is greater than B
<=	1 IF A<=B GOTO 100	A is less than or equal to B
>=	2 IF A>=B THEN STOP	A is greater than or equal to B
AND	10 IF A=0 AND B=0 GOTO 111	Logical operation of AND
OR	20 IF C=0 OR B=0 GOSUB 100	Logical operation of OR

APPENDIX 4

SPECIAL SYMBOLS

COMMANDS,

STATEMENTS,

SYMBOL EXAMPLE

PURPOSE

\$	10 A\$="ABCDE"	STRING IDENTIFIER
"	10 A\$="ABCDE"	STRING ENCLOSURES
:	10 A=1:B=0:C=6	ALLOWS MULTIPLE STATEMENTS ON A LINE
;	22 PRINT A;B	ALLOWS SAME LINE PRINTING, BUT
	23 PRINT A\$;B\$	CONCATENATED IN CASE OF STRING
	24 PRINT A;B\$	
,	12 PRINT A,B	ALLOWS SAME LINE PRINTING, ELEMENTS
,	13 PRINT A\$,B	ARE SEPARATED BY TABBED PRINTING POSITION
PI	PI	VALUE OF PI IS 3.14159
RUBOUT		THIS IS USED TO DELETE THE CURRENT INPUT LINE BEFORE THE RETURN KEY WAS DEPRESSED.

APPENDIX 5

BUILD-IN FUNCTIONS

FUNCTION	EXAMPLE	PURPOSE
ABS	ABS(X)	Absolute value of X
ASC	ASC(A\$)	ASCII code for the first character of string expression
ATN	ATN(X)	Arctangent of X; result is in radians
CHR\$	CHR\$(X)	Generates a one-character ASCII string; X is in the range 0-255
COS	COS(X)	Cosine of X; X must be expressed in radians
EXP	EXP(X)	Return constant of naperian (= 2.71827) raised to power of the argument X.
INT	INT(X)	Largest integer less than or equal to X
LEFT\$	LEFT\$(A\$,N)	Returns leftmost N characters from string A\$
LEN	LEN(A\$)	Returns the length of the string A\$
LN	LN(A)	Natural logarithm of A; A must be greater zero.
LOG	LOG(N)	Logarithm of N; the base of logarithm is ten, N must be larger than zero.
MID\$	MID\$(A\$,A,B)	Returns B characters from string A\$, starting with the Ath character.
STR\$	STR\$(A)	Let the number A as a string
RIGHT\$	RIGHT\$(B\$,C)	Returns rightmost C characters from string B\$.
RND	RND(A)	Pseudo-random number between 0 and specified value.

SGN	SGN(X),	Sign function; equal 1 for X>0, 0 for x=0 and -1 for x<0.
SIN	SIN(X)	Sine X; X must be expressed in radians.
SQR	SQR(A)	Square root of A; A must be > = 0.
TAN	TAN(X)	Tangent X; X must be expressed in radians.
VAL	VAL(A\$)	Returns numeric representation of string. If string not numeric, return zero.
HEX\$	HEX\$(A)	Return hexadecimal value of A.
FN	FN A(X)	User defines function FN A\$(X\$)=X\$&""
JOYST	JOYST(A)	Return value of joystick unit A.

***12.DIVIDED BY ZERO (/0 ERROR)**

10 A=5

20 PRINT A/B

***13.TYPE MISMATCH (TM ERROR)**

1. A string variable name is assigned a numeric value or vice versa.

10 READ A,B\$,C

20 DATA 1,2,3

10 READ A,B,C

20 DATA 1,2,K

2. A function that expects a numeric argument is given a string argument or vice versa.

PRINT LEFT\$(A,3)

PRINT 3 OR 4

CALL SCREEN(6&1)

***14.NO RESUME (NR ERROR)**

An error trapping routine is entered but contains no RESUME statement.

```
> 10 ONERRGOTO 200  
> 20 B = 10  
> 30 INPUT A  
> 40 PRINT B/A  
> 50 END  
> 200 PRINT A  
> RUN  
?0  
NR ERROR IN 200
```

***15.RESUME WITHOUT ERROR (RE ERROR)**

A RESUME statement is encountered before an error trapping routine is entered.

```
> 10 ONERRGOTO 200  
> 20 INTPUT A  
> 30 IF A=0 GOTO 100  
> 40 END  
> 100 PRINT A  
> 200 RESUME  
> RUN  
?0  
RE ERROR IN 200
```

***16.NEXT WITHOUT FOR (NF ERROR)**

A FOR was encountered without a matching NEXT.

```
> 10 FOR I=0 TO 100  
> RUN  
FN ERROR IN 10
```

***17.FOR WITHOUT NEXT (FN ERROR)**

```
> 10 FOR I=1 TO 10  
> 20 J=J+I  
> 30 PRINT J  
> 40  
READY  
> RUN  
1  
FN ERROR IN 30
```

***18.RETURN WITHOUT GOSUB (RG ERROR)**

```
> 10 RETURN  
> RUN  
RG ERROR IN 10
```

***19.OUT OF DATA (OD ERROR)**

A READ statement is execute when there are no DATA statement with unread data remaining the program.

```
> 10 READ A,B,C  
> 20 PRINT A,B,C  
> 30 DATA 1,2
```

***20.BAD LINE NUMBER (BL ERROR)**

1. A line number specified in EDIT, LIST, DEL, RUN... is not found in program.
2. Line number equals 0 or greater than 9999 or invalid line number.

```
> 10 ONERRGOTO 300  
> 20 INPUT A  
> 30 PRINT A  
> 40 GOTO 20  
> RUN
```

BL ERROR IN10

***21.BAD SUBSCRIPT (BS ERROR)**

1. subscript in DIM ≤ 0 or greater than 254.
 > DIM A(0)
 > DIM B (256)
2. subscript in CALL less than -65535 or greater than 65535.
 > CALL HCHAR (0,0,65,100000)
 > CALL 65537

***22.INCORRECT STATEMENT (IS ERROR)**

1. A command is used as a statement.

> 10 A=10
> 20 DEL
> RUN
> IS ERROR IN 20

> 10 A=2
> 20 DATA "\$100", "\$50"
> 30 EDIT 20
> 40 RED A\$, B\$
> 50 PRINT A,B
> RUN
IS ERROR IN 30

2. a value follow STEP is 0.

> 10 FOR I=1 TO 10 STEP A
> 20 PRINT I
> 30 NEXT
> RUN
IS ERROR IN 10

3. any error not covered by another message.

> 10 DIM A(5,5)
> 20 FOR I=1 TO 11
> 30 A(I,I)=I TO 11
> 40 PRINT A(I,I),
> 50 NEXT

> RUN

1 2 3 4

5

IS ERROR IN 20

*23.TAPE I/O ERROR (TP ERROR)

Data transfer error during tape loading.

APPENDIX 8

PATTERN-IDENTIFIER CONVERSION TABLE

Now, let's have a practice, the following transformation is performed according to the above rules.

Here are the scales of C MAJOR, D MAJOR and E FLAT MAJOR:

C MAJOR "CDEFGAB + C"

D MAJOR "DE # FGAB + # CD"

E FLAT MAJOR "#DFG#G#A+C+D+ #D"

C MAJOR

D MAJOR

E FLAT MAJOR

APPENDIX 11

HARDWARE SPECIFICATION

1. VIDEO

- (1) OUTPUT LOAD : 75Ω
- (2) OUTPUT LEVEL: 0 — 1 VOLT (WHITE)

2. RF

- (1) OUTPUT LOAD : 75Ω
- (2) CHANNEL : VHF CH4 (STANDARD)

3. AUDIO

- (1) SOUND OUTPUT : 1.5 Vp-p
- (2) TAPE LOAD : 500m Vp-p
TAPE DUMP : 90m Vp-p

4. POWER DISSIPATION (MAIN BOARD)

- (1) +5V : 600 mA
- (2) +12V : 200 mA
- (3) -5V : 20 mA

5. POWER ADAPTOR

- (1) +5V : 900 mA
- (2) +12V : 300 mA
- (3) -5V : 100 mA
